```
the invention tradece to insume of process.

polypeptides and polynucleotides. GCREC polypeptides are useful for screening compounds that modulate their activity. They are useful in the diagnosis, prevention and treatment of disorders which include cell proliferative disorders such as arteriosclerosis, hepatitis, myelofibrosis, psoriasis and cancer including adenocarcinoma, leukaemia, proliferative disorders such as epilepsy, ischaemic cerebrovascular disorders such as epilepsy, ischaemic cerebrovascular disease, alzheimer's disease, Pick's disease, dementia, parkinson's disease, ataxias, multiple sclerosis, bacterial and viral cardiovascular disorders such as arteriovenous fistula, atherosclerosis, hypertension, vascular tumours, myocardial infarction, hypertension, vascular tumours, myocardial infarction, hypertension, pacticis andocarditis, cardiomyopathy, myocarditis, disease, infective andocarditis, cardiomyopathy, myocarditis, diarrhoea, emesis, anorexia, nausea, peptic ulcer, cholelithiasis, diarrhoea, constipation, acquired immune deficiency syndrome (Alisase, allergies, spondylitis, amyloidosis, anaemia, asthma, contact dematitis, Crohn's disease, diabetes mellitus, Goodbasture's syndrome, amplement of disease, diabetes mellitus, cardiomia arthmatorial amplement of disease, diabetes mellitus, cardiomia and cardiomia amplement of disease, diabetes mellitus, cardiomia a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      emphysema, Grave's disease, out, multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus, uveitis, viral, bacterial, fungal, parasitic, protozoal and helminthic infections and trauma; metabolic disorders such as diabetes, obesity and osteoporosis; and viral infections such as infection caused by viral agent classified as adenovirus, arenavirus, bunyavirus. Polymucleotides of the invention are useful as probes for assessing toxicity of test compounds. They are also used in gene therapy. The present sequence is human G-protein coupled receptor 2 (GCREC-2) cDNA
                                                                                                        Novel G-protein coupled receptors and polynucleotides useful for diagnosis, treatment and prevention of disorders of cell proliferation, neurological, cardiovascular, metabolic disorders and viral infections.
                                                                                                                                                                                                                                                                                                                                                           invention relates to human G-protein coupled receptor (GCREC)
                                                                                                                                                                                                                                                                           Claim 5; Page 111-112; 115pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated AXOR89 polypeptide (G-protein coupled receptor) and its polynucleotide. The novel AXOR89 polypeptide and polynucleotide encoding the polypeptide, is useful for identifying agonists and antagonists (or inhibitors) that are potentially useful in treating conditions associated with an AXOR89 imbalance, much as betterfal, fungal or protozoan infections, cancers, pain, asthma, Parkinson's Disease, diabetes, obesity, anorexia, bulimia, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, allergies, benign prostatic hypertrophy, migraine, vomitting, psychotic and neurological disorders, anxiety, schizophrenia, manic depression, delirium, dementia, dyskinesias, such as Huntingron's Disease or Gilles dela Tourette's syndrome. The polynucleotide sequence may also be used for chromosome localisation or tissue expression studies. The AXOR89 is used as a parker and activities or to produce fusion proteins. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

New G-protein coupled receptor (GPCR) polypeptide with homology to P2Y purinoreceptor, useful for treating e.g. inflammation or cancers in a patient, or for screening GPCR agonists or antagonists for treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GGCATTATCTTCCTCGTGGGATTTCCAGGCAATGCAGTGATAGTCATATCCACTTACATTTTC 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                               The invention relates to a novel G-protein coupled receptor (GPCR), and the polynucleotide encoding it. The protein of the invention has neuroprotective, anti-inflammatory, cytostatic, cardiovascular, antiallergic, hypotensive, antiatreriosclerotic, and osteopathic activity. The GPCR polypeptide is useful for manufacturing a medicament the treating a patient who needs to upregulate a receptor. Preferably, therapeutically useful areas are hypertension, aschma, and artherosclerosis. The sequence encodes the G-protein coupled receptor of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

The invention relates to human novel polynucleotides and polypeptides. The sequences are useful for the treatment, prevention and diagnosis of disorders such as trauma, viral/parasitic/bacterial infections, Alzheimer's disease, Huntington's disease, Parkinson's disease, behavioural disorders, anxiety, addiction, pain, hair growth disease, alopecia, pigmentation disorder, inflammatory disorders such as osteoned theumatoid arthritus, inflammatory bowel disease, crohn's disease, acquired immunodeficiency syndrome (AIDS), cancers such as colon cancer obesity, graft versus host disease, ulcer, bulimia, anorexia and edementia. Sequences ABSS1728-ABSS1748 represent human novel
                                                                                                                                                                                                                                                                                                                                              TITGGAAATTGCACTGATGAAACATCCCACTCAAGATGCACTACCTCCCTGTTATTAT

The present invention relates to a new polypeptide that comprises any of 17 fully defined sequences of 43-990 amino acids given in the specification. The NOWY polypeptide, nucleic acid and antibody of the invention are useful for treating or preventing a pathological condition in humans with a NOWX associated disorder, e.g. Von Hippel-Lindau syndrome, cirrhosis, transplantation disorders, pancreatitis, obesity, diabetes, autoimmune disease, renal artery stenosis, interstitial.

Alzheimer's disease, acoustic transma, cancer, infertility, alzheimer's disease, acoustic transma, cancer, infertility, alzheimer's disease, acoustic transma, cancer, infertility, cardiomyopathies, atherosclerosis, hypertension, congenital heart defects, scleroderma, endometriosis, haemophilia, dementia, stroke, parkinson's disease, Huntington's disease, epilepsy, multiple sclerosis, anxiety, pain, leukaemias, hypothyroidism, psoriasis, acne, wounds and anxiety, pain, leukaemias, hypothyroidism, psoriasis, acne, wounds and constitute of a medicament for the manufacture of a medicament for asthmatical and analysis and and analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                treating a syndrome associated with a human disease, specifically a Novx-associated disorder. They may also be useful in therapeutic applications including protein therapy, as small molecule drug targets, as antibody targets, as dispossite and/or proposetic markers, in gene therapy, as research tools and in tissue regeneration. The present nucleic acid sequence encodes one of the 17 novel proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         347 ATGAATGAGCCACTAGACTATTTAGCAAATGCTTCTGATTTCCCCGATTATGCAGCTGCT 406
         Isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing, diagnosing and researching pathological conditions in humans with a NOVX-associated disorders, e.g. cancer, stroke or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   rrrddadarrrcardranarrandcadrrcadcrrccarrrcandcrarardaddad

                                                                                                                                                                                                                                                                                                                                                               The sequence encodes a human G-protein coupled receptor (GPCR), hRUP21. The endogenous and non-endogenous, constitutively activated versions of indemnan G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vivo system, incorporating GPCRs can be utilised to elucidate and understand the roles these receptors play in the human condition, both normal and diseased
                                                                                                                                                                                                                                                        Endogenous and non-endogenous versions of human G-protein coupled receptors for direct identification of candidate compounds as agonists,

An isolated P2Y-like receptor polypeptide (HIPHUM 0000037) which can be used for the identification of agonists and antagonists which may be used to treat an immune or inflammatory disease.

Claim 5; Page 28-29; 35pp; English.

The invention relates to an isolated P2Y-like receptor polypeptide (ABB83818-ABB83819) which is also referred to in the specification as HIPHUM 0000037. An effective amount of a substance (agonist or antagonist) which modulates P2 receptor activity is useful to treat a canagonist) which modulates P2 receptor activity is useful to treat a subject having a disorder that is responsive to P2Y-like receptor consistence may also be used to manufacture a medicine for the treatment or prophylaxis of a disorder that is responsive to stimulation or modulation or prophylaxis of a disorder that is responsive to stimulation or modulation or prophylaxis activity. Disorders which may be treated include colon cancers, asthma, COPD, Crohn's disease, irritable bowel syndrome, colon cancers, asthma, copp, crohn's disease, irritable bowel syndrome, colitis, rheumatoid arthritis, inflammatory bowel syndrome, ulcerative autoimmune diseases, dermatitis, glomerulonephritis allergies, allergic rhinitis, inflammatory pain and general inflammation such as tendonitis, colymyositis or prostatitis. The invention provides alternative substances for the treatment of immunological and inflammatory diseases.

The present sequence is that the P2Y-like receptor variant encoding gene the invention

ABK11381 g ò 셤 ò 윱 δ g δ 임 ð g chromosome 13) encodes a purinergic-related G-protein coupled receptor (GPCR) of the invention. GPCRs constitute a major class of proteins responsible for signal transduction within a cell. Upon binding of a ligand to the extracellular portion of a GPCR, a signal is transduced resoluting in a biological or physiological change within the cell. The GPCR proteins can be divided into five families, family I contains the curinergic GPCRS (e.g. the P2Y receptors). P2Y receptors are characterised by their selective responsiveness towards AFP and its characterised by their selective responsiveness towards AFP and its characterised by their selective responsiveness towards AFP and its characterised by their selective receptors are not in the treatment of control and nucleic acids of the invention are useful in the treatment of protein and nucleic acids of the invention are useful in the treatment of the invention is useful for: the development/identification of the invention is useful for: the development/identification of the characterised of the activity of the GPCR, or the interaction of the GPCR protein. The cycle acids of the invention and account and anotecule with which it normally interacts; and treating a disorder characterised by an absence of, or inappropriate expression of the GPCR protein. The GPCR nucleic acids of the invention are useful in diagnostic assays to defining GPCR expression; and in gene therapy to treat patients with the number of the invention are useful in diagnostic assays to the invention are useful in diagnostic assays to the invention are useful in diagnostic assays to the invention; and in gene therapy to treat patients with the number of the controlling GPCR expression; and in gene therapy to treat patients with the number of the invention and in gene therapy to treat batients with the number of the controlling GPCR protein and in gene decreased in the number of the controlling acids of ö 540 120 120 180 GGCATTATCTTCCTGGGGATTTCCAGGCAATGCAGTAGTGATATCCACTTACATTTTC 180 240 240 300 300 420 TGCTTTTCCATTCACAAAACTCGATGTGCAGTTGTAGCCTGTGCTGTGGTGGATCATT 480 TITGGAGATITCATGTGTAAGTTTATCCGCTTCAGCTTCCATTTCAACCTGTATAGCAGC 360 TTTGGAGATTTCATGTGAAGTTTATCCGCTTCAGCTTCCATTTCAACCTGTATAGCAGC 360 480 TCAGCCTGTCTCGACCTCACCAGTTCGGATGAACTCAATACTATTAAGTGGTACAACCTA 600 099 ATCCTCTTCCTCACCTGTTTCAGCATCTTCCGCTACTGTGTGATCATTCACCCAATGAGC 420 rcasccrercicaccreacites are reacted and reacted research con ATTITIGACTGCAACTACTITICTGCCTCCCCTTGGTGATAGTGACACTTTGCTATACCACG 660 9 9 1 ATGAATGAGCCACTAGACTATTTAGCAAATGCTTCTGATTTCCCCCGATTATGCAGCTGCT 1 ATGAATGAGCCACTAGACTATTTAGCAAATGCTTCTGATTTCCCCGATTATGCAGCTGCT AAAATGAGACCTTGGAAGGAGCAGCATCATTATGCTGAACCTGGCCTGCACAGATCTG CTGTATCTGACCAGCCTCCCCTTCCTGATTCACTACTATGCCAGTGGCGAAAACTGGATC CIGIALCIGACCAGCCTCCCCTTCCTGATTCACTACTATGCCAGTGGCGAAAACTGGATC GGCATTATCTTCCTCGTGGGATTTCCAGGCAATGCAGTAGTGATATCCACTTACATTTTC AAAATGAGACCTTGGAAGGAGCAGCACCATCATTATGCTGAACCTGGCCTGCACAGATCTG ATCCTCTTCCTCACCTGTTTCAGCATCTTCCGCTACTGTGTGATCATTCACCCAATGAGC recririccaricacaaaacresarsiscasistrarsiscassiscassiscasis reacregrationary ATTITGACTGCAACTACTITCTGCCTCCCCTTGGTGATAGTGACACTTTGCTATACCACG 0; Gaps Score 1012.4; DB 6; Length 1014; Pred. ```
The invention relates to a purified human P2Y1-like G protein-coupled receptor (GPCR) polypeptide and the nucleic acids encoding it (including conditions) are demonsters, fragments, variants, or a sequence encoding a protein at least 50% identical to the GPCR. Also included are encoding a protein at least 50% identical to the GPCR. Also included are concoding a polynucleorising the mucleic acid, a host cell containing the vector and the identification of modulators of the GPCR especially those that reduce the activity of the GPCR. The nucleic acid is useful concerned a polynucleoride encoding the GPCR in a biological sample. The GPCR and nucleic acid are useful for screening for agents which concerned a cartivity of the GPCR and for modulators of the GPCR. The GPCR and viral infection, pain, cancer, anorexia, bullimia, asthma, contral nervous system (GNS) disease such as bacterial, fungal, contral nervous system (GNS) disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, diabetes, angina pectoris, contral infarction, ulcer, inflammation, allergy, multiple sclerosis, benign prostatic hypertrophy, psychotic and neurological disorders, disorders such as Parkinson's disease, anxiety, schizophrenia, manic disorders multiple sclerosis, disorders such as Parkinson's disease, anxiety, schizophrenia, manic disorders, disease and Tourette's syndrome. The present sequence encodes the P2Y1-like GPCR of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

The invention relates to a method for screening G protein-coupled receptor (GPCR) genes (ABZ42870-ABZ43216) and/or GPCR proteins (ABB95596-ABB95421) by extracting open-reading frames containing 6-8 transmembrane domains with 250-1000 amino acid residues to give a gene homologous with a known GPCR gene. The receptor proteins and encoded genes are useful for studying in vivo signal transduction mechanism and identifying targets for drug development e.g. based on olfactory and gustatory receptors in form of agonists and antagonists by screening intrinsic and extrinsic ligands as bitter taste inhibitors, taste enhancers and fragrance
                                                                                                                                                                                               840

The invention provides new G-protein coupled receptor (GPCR) polypeptides designated TGR2, TGR38, TGR18, TGR164, TGR343 and TGR358 and encoding bolynucleotides. The polypeptides can be expressed by standard DNA recombination methodology. The polypeptides are useful for screening or identifying modulators of GPCR or signal transduction. The modulators of signal transduction are useful for treating or preventing TGR-associated disorders, e.g. asthma, multiple solerosis or kidney disease. The polypeptides are useful as targets for diagnosing or treating e.g. epplepps, stroke, neurodegeneration, hypogonadism, hyperprolactinemia, asymptomatic urinary abnormalities, hypertension, nephrolithiasis, cirrhosis, lesions, jaundice, psoriasis, lupus erythematosus, or acute inflammatory dermatoses. The present sequence represents a human TGR164
                                                                                                                                                                                                                                                                               TGR358; antiasthmatic; neuroprotective; cerebroprotective; nephrotropic; anticonvulsant; hypotensive; hepatotropic; dermatological; human; immunosuppressive; antiinflammatory; gene; ds.

New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or autoimmune diseases.

Disclosure, Fig 1; 523pp; English.

The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino cacids. Also described: (I) an assay for the detection of a particular GPCR, or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or avidity for a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an artibody against a particular GPCR, and in the production of specific antibody against a particular GPCR, and in the production of specific antibodies. The peptides and antibodies are also useful for detecting the CC antibodies. The peptides and antibodies are also useful for detecting the creating immune-related disease, immunological cell proliferative compensation-related diseases, convert-related diseases, cell proliferative diseases, or autoimmune diseases, erg. ALDS, Alzheimer's disease, atheroscierosis, bacterial, fungal, protozoan or viral infections, atheroscierosis, bacterial, fungal, protozoan or viral infections, osteoarthritis, osteoporosis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, diabetes, graft versus host disease, parkinson's disease, multiple sclerosis, pain, psoriasis, cancer, dependentia, mental retardation, memory entited. ö loss, epilepsy, asthma, tuberculosis, obesity, nausea, hypertension, hypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be used in immunoassays and manunodiagnosis. ABZ42523 to ABZ42869 encode GPCR proteins given in ABP81675 to ABP82018, which are used in the exemplification of the present invention

The present invention relates to novel G-protein coupled receptors (GPCRs) and the nucleic acids encoding them. The invention is useful for tracting viral, bacterial and fungal infections, inflammatory and neoplastic processes, pain, diabetes, hypertension, osteoporosis, angina pectoris, myocardial infarction and atherosclerosis. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to G protein-coupled receptor (GPCR) polypeptides and the polymuclectides encoding them. The GPCR polypeptides are useful for preparing a composition for identifying compounds as receptors, inverse agonists or partial agonists, having potential applicability as therapeutic agents. This sequence represents human GPCR cDNA of the
